RIP13 is identical to the N-COR, except that it has 10 unique amino acids at its N-terminus instead of N-COR's 1017 amino acids of its N-terminus and contains a 48 amino acids deletion (N-COR No. 1235-1282). In addition, RIP13 has one more alanin (N-COR No. and a serine deletion (2145) and a amino acid change from A to P. These minor differences may be due to polymorphism. RIP13 sequence has been reconstructed using three clones whose sequences are overlapped partially. There is a deletion form of RIP13 containing a deletion of I19 amino acids (RIP13delta1).

Lubmitted (01-APR-2000) Whitehead Institute/MIT Center for Genome Research, 320 Charles Street, Cambridge, MA 02141, USA ON May 2, 2000 this sequence version replaced gi:7382510.

All repeats were identified using RepeatMasker:
Smit, A.F.A. & Green, P. (1996-11997)
                                                                                                                                                                                                                                                                                                                                                 Center: Whitehead Institute/ MIT Center for Genome Research
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 NOTE: This is a 'working draft' sequence. It currently consists of 49 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N. but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Center Clone name: 665_C_13

nger.ac.uk Clone requests: clonerequest@sanger.ac.uk
clot this sequence version replaced gi:1502264.

the assembly data is compared from overlapping clones.

nces are found these are annotated as variations
of the overlapping clone name. Note that the
otation may not be found in the sequence submission
to the overlapping clone, as we submit sequences with
overlap as described above.

abbreviations are used to associate primary accession
in the feature table with their source databases:
in, SWISSPROT; Tr:, TREMBL; Wp:, WORMPEP; Information

               http://www.ganger.ac.uk/Projects/C_elegans/wormpep_RP71-71M17 is http://www.ganger.ac.uk/Projects/C_elegans/wormpep_RP71-71M17 is from a Zebrafish mixed sex BAC library VECTOR: pTARBAC2 This sequence is the entire insert of clone RP71-71M7 This clone was isolated from BAC library RPC1-71 created by Pieter deJong and provided by Gareth Howell (Wellcome Trust Sanger Institute, Cambridge, UK)

This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chamistry or covered by high quality data (i.e., phred quality >= 0.0); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest, except on the rare occasion of the clone being a YAC.

Clone-derived Sebrafish pUC subclones occasionally display inconsistency over the length of monouncleotide A/T runs and conserved TA repeats. Where this is found the longest good quality representation will be submitted.

Repeat names beginning 'Dr' were identified by the Recon repeat discovery system (Zhirong Bao and Sean Eddy, submitted), and those beginning 'drr' were identified by Rick Waterman (Stephen Johnson by Washin Dry Mashin Dry 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          141. .4315

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         NOTICE: This sequence may not represent the entire insert of this clone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    NEIGHBORING SEQUENCE INFORMATION:
The clone sequenced to the left is RP11-223J6, 2000 bp overlap.
Actual start of this clone is at base position 135702 of
RP11-223J6; actual end is at base position 135351 of RP11-153P14.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  An unresolved tandem repeat exists between bases 53752-60786 and between bases 90078-126411.

It currently consists of 4 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1919 53918: contig of 53918 bp in length

1919 54018: gap of 100 bp

1019 57797: contig of 3779 bp in length

1928 57897: gap of 100 bp

1938 147863: contig of 89966 bp in length

1964 147963: gap of 100 bp

1964 150768: contig of 2806 bp in length.

1964 150769: contig of 2806 bp in length.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Contact: sequence submissions@genome.wi.mit.edu

JOURNAL

COMMENT

CLONE LENGTH: This sequence does not necessarily represent the entire insert of this clone. Overlapping regions of clones are only sequenced and submitted once, so the sequence for the remainder of the insert may be found in the record for the adjacent clones. Overlapping clones are noted at the beginning and end of the Features listing.

ANNOTATION OF FEATURES:

STS are identified using ePCR (Genome Res. 7:541-550) searches of a local database that includes entries from dbSTS, GDB, and local mapping efforts.

Repeats are identified using RepeatMasker (A. Smit and P. Green, unpublished.) for Human and Mouse sequences.

Genes and Region of sequence similarity are identified by BLAST (Nuc. Acids Res. 25:3389-3402) similarity (expect < 1e-34) to the EST and cDNA sequences. Genes demonstrate at least two exons flanked by consensus splice sites that maintained sequence continuity across the splice junctions. Sequences that are not

                            standard of double strand coverage with a minimum of 2 clones and 2 reads with no ambiguities or 2 chemistries with a minimum of 2 clones and 3 reads with no ambiguities. If the sequence quality for a region does not meet this standard, it will be indicated in the annotation as Low Coverage.

                                                                                                                                                                                                                                                                                                                                                                                         CLONE LENGTH: This sequence does not necessarily represent the entire insert of this clone. Overlapping regions of clones are only sequenced and submitted once, so the sequence for the remainder of the insert may be found in the record for the adjacent clones. Overlapping clones are noted at the beginning and end of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ADVIATION OF EXAMPLES.

STEE are identified using ePCR (Genome Res. 7:541-550) searches of a local database that includes entries from dbSTS, GDB, and local mapping efforts.

Repeats are identified using RepeatMasker (A. Smit and P. Green, unpublished.) for Human and Mouse sequences.

Genes and Respon of sequence similarity are identified by BLAST (Nuc. Acids Res. 25:3389-3402) similarity (expect < 1e-34) to the EST and cDNA sequences. Genes demonstrate at least two exons flanked by consensus splice sites that maintained sequence continuity across the splice junctions. Sequences that are not identical matches are annotated as similar.
                                                                                                                                                                                                                                Direct Submission
